Ventura, CA (April 1, 2004) Magnuson Products, manufacturer of superchargers and supercharger systems for foreign and domestic vehicles is pleased to announce the availability of the totally new intercooled supercharger system for the Chevrolet SSR. (C.A.R.B. D-488-5)

The supercharger has been spun around 180°, to better utilize the stock air path. The genius of this design is it keeps a straight airflow path into the supercharger inlet, which reduces friction and pumping losses. This all-new intercooled supercharger system utilizes the Magnuson MP112 supercharger with internal bypass valve. Power increases are expected to be around 100 HP and 100 ft-lbs of torque *at the rear wheels*, depending on the presence of aftermarket products and engine condition.

Intercooled systems are complete with all components necessary for installation. Included in the kit is a cast aluminum intake manifold (replacing the factory nylon manifold), intercooler core, coolant circulation pump, heat exchanger and all necessary hardware to complete the entire installation. This system does not require any hood modifications.

Other components included are new fuel injectors, fuel rails, factory "push lock connectors" and regulator adapter. Computer programmer communicates with the factory ECU for proper calibration of the supercharger system. Transmission shift points, line pressures and convertor strategies are optimized for use with the increase in torque and horsepower.
